

xeokit

a Web Programming Toolkit
for BIM & Engineering
Graphics

WebGL Meetup, 18 November, 2020

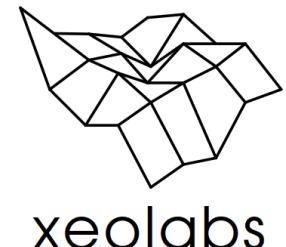

<https://slides.com/xeolabs/xeokit-sdk>

Lindsay Kay

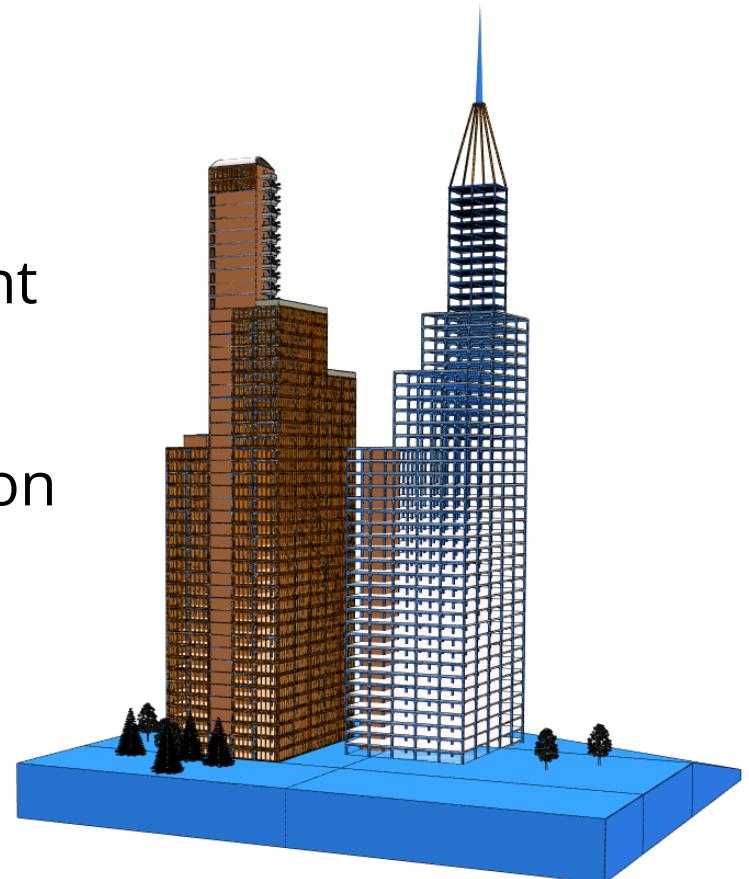

3D software developer at xeolabs.com

- [@xeolabs](https://twitter.com/xeolabs)
- github.com/xeolabs

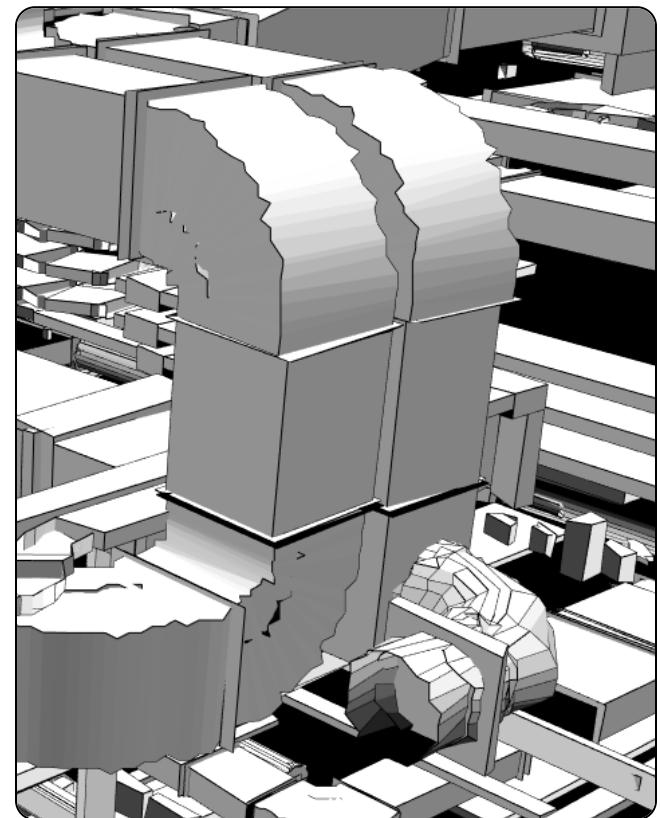

1. What is BIM?

- Building Information Modeling
- Digitized construction management
- Centered around a meta model, provided by the Industry Foundation Classes (IFC)
- Use models to collaborate on planning, design, construction and maintenance

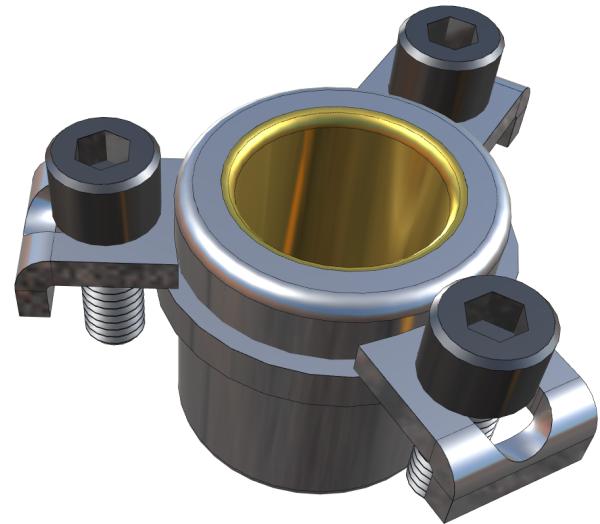

2. WebGL BIM Challenges

- Load large models quickly
- Fit large models in browser memory
- Draw many objects, interactively
- Navigate precisely, in both open and tight spaces
- Accurately render full-precision geometry

3. What is xeokit?

- A JavaScript SDK for developing model viewers for BIM and engineering
- Uses WebGL (1)
- Loads and views big models, at full-precision
- Loads IFC, glTF, OBJ, STL, 3DXML, XKT & metadata to classify objects
- Convert models with open source tools & host them on your own server

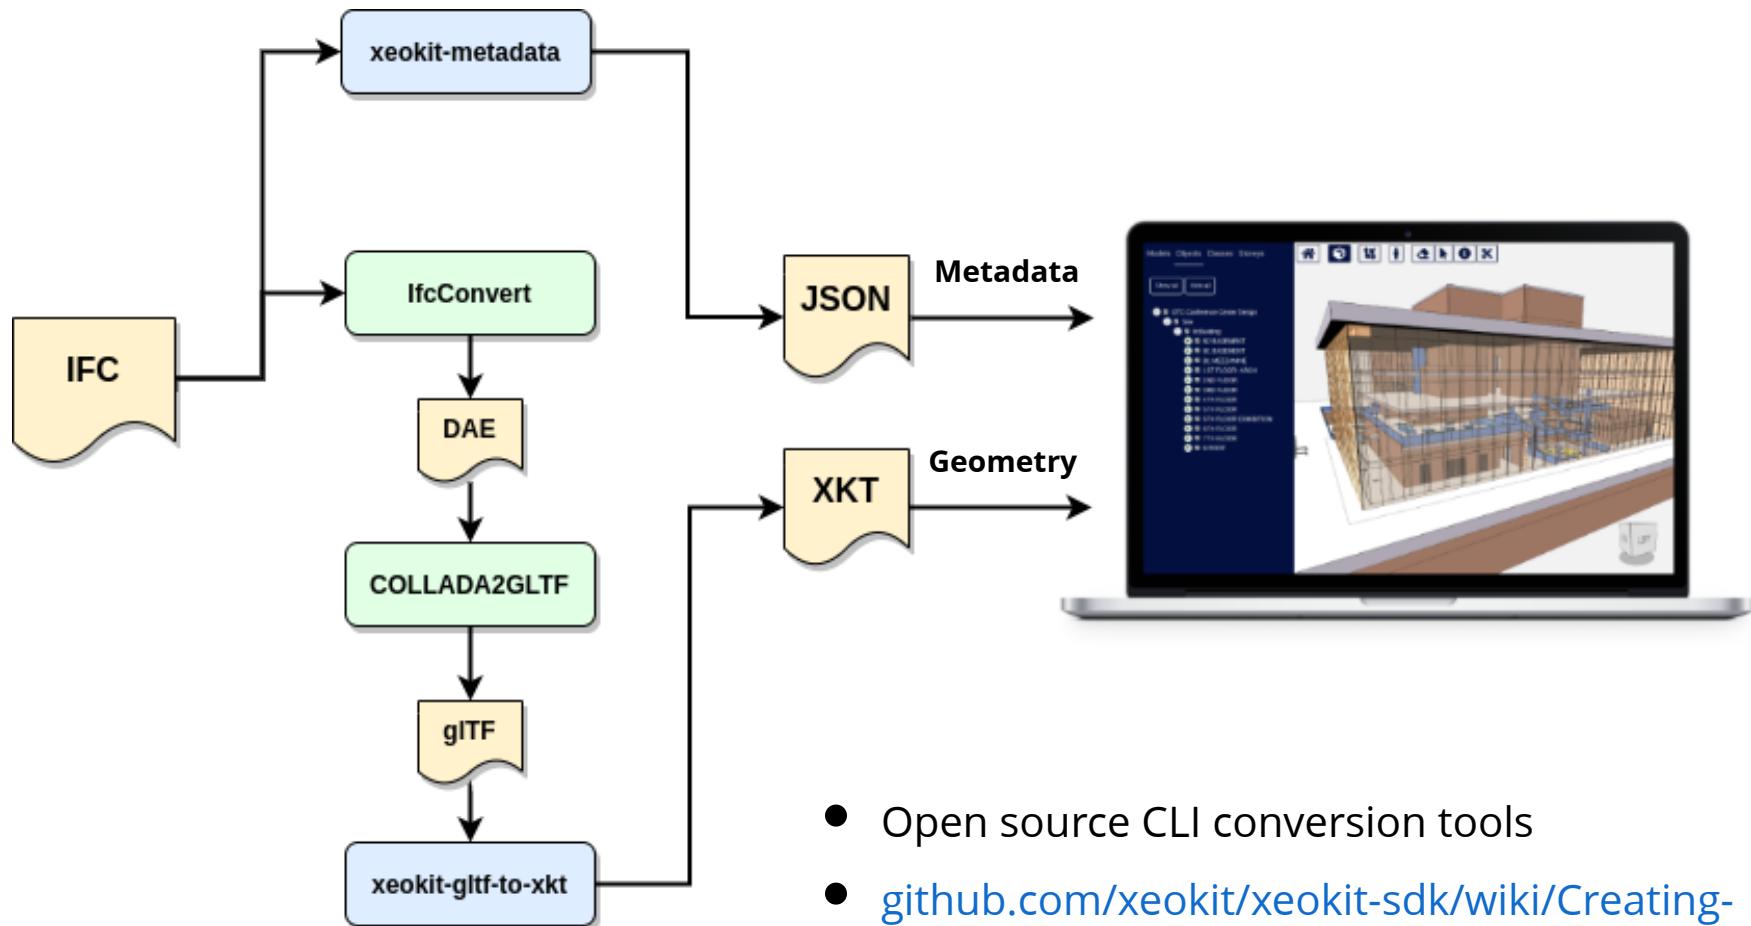

```
const viewer = new Viewer({  
    canvasId: "myCanvas"  
});  
  
viewer.camera.eye = [0,0,10];  
viewer.camera.look = [0,0,0];  
viewer.camera.up = [-0, 1, 0];  
  
const xktLoader =  
    new XKTLoaderPlugin(viewer);  
  
const model = xktLoader.load({  
    src: "myModel.xkt",  
    metaModelSrc: "myModel.json"  
});
```

5. Loading Big Models Quickly

- xeokit has a native, binary geometry format called "XKT"
- Quantized, tiled RTC vertex positions & oct-encoded normals
- 48 bits per position, 16 bits per normal
- Pre-computed wireframe indices
- Convert IFC to XKT using open source CLI tools

6. Converting IFC Models for xeokit

7. Loading IFC Models into xeokit

Minimal example

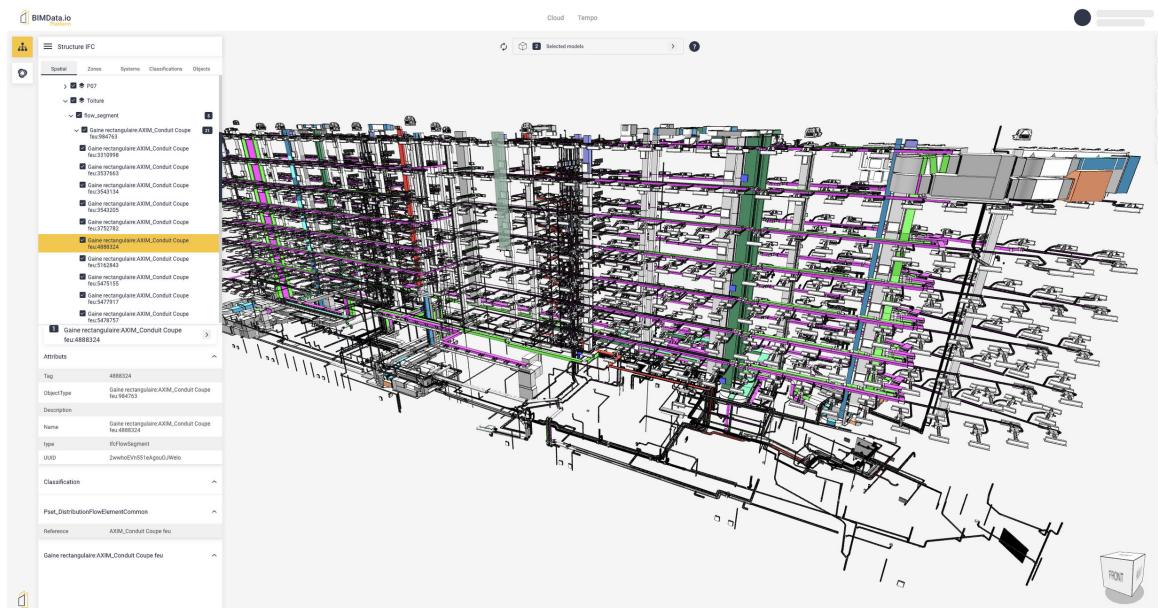

```
1 import {Viewer} from "../src/viewer/Viewer.js";
2 import {XKTLoaderPlugin} from
3   "../src/plugins/XKTLoaderPlugin/XKTLoaderPlugin.js";
4
5 const viewer = new Viewer({
6   canvasId: "myCanvas"
7 });
8
9 viewer.camera.eye = [1842022, 10, -5173301];
10 viewer.camera.look = [1842022, 10, -5173401];
11 viewer.camera.up = [-0.0, 1.0, 0.0];
12
13 const xktLoader = new XKTLoaderPlugin(viewer);
14
15 const model = xktLoader.load({
16   metaModelSrc: "metadata.json",
17   src: "geometry.xkt"
18 });
```

xeokit.github.io/xeokit-sdk/examples/#loading_XKT_Schependomlaan

8. Minimizing Memory Footprint

- xeokit stores geometry on the GPU, not in browser
- Quantized RTC vertex positions, oct-encoded normals
- 48 bits per double-precision position, 16 bits per normal

A large plumbing model at [BIMData.io](https://bimdata.io)

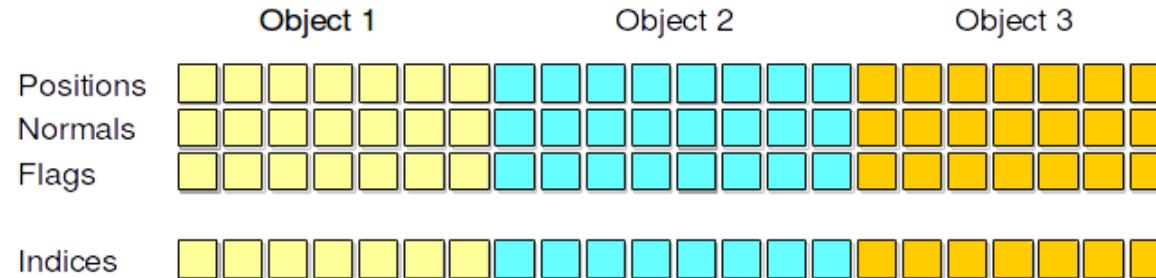

9. Drawing Many Objects Interactively

xeokit uses two rendering techniques:

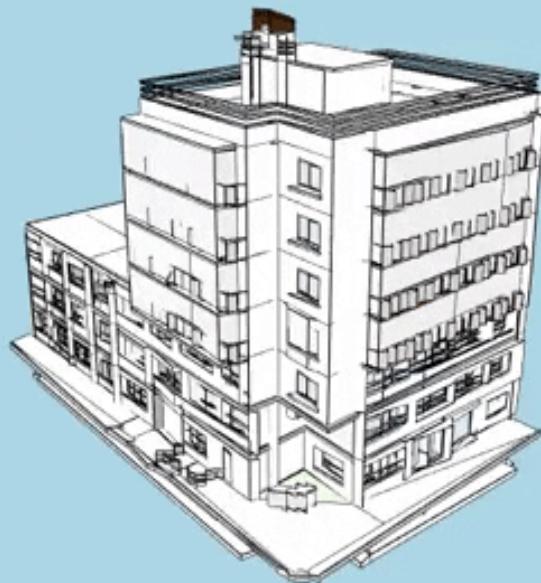

1. ANGLE_instanced_arrays

2. Batched Geometry Arrays

- Combine single-use geometries into a single set of VBOs
- Add an array of per-vertex flags, to hold object states
- Vertex shader "discards" vertex when visible flag false
- Update all vertex flags for an object to set its visibility

10. Accurate Rendering - Rounding Jitter on WebGL

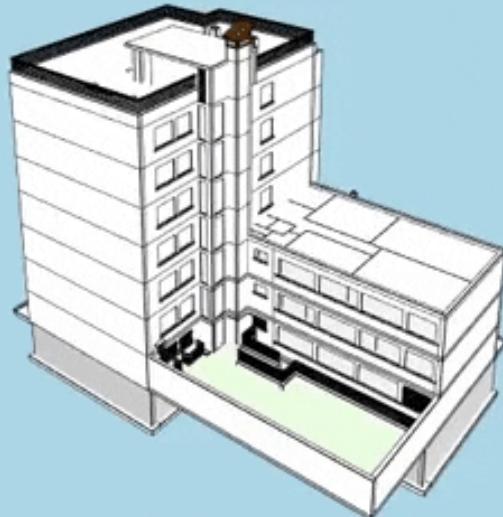

- Many BIM models use double-precision coordinates
- GPUs are usually only single-precision, however
- **Need to emulate double-precision rendering to eliminate rounding jitter**

Model centered at (1842022, 10, -5173301), provided by [BIMData.io](#)

xeokit.github.io/xeokit-sdk/examples/#loading_XKT_jitter_singlePrecision_MAP

11. Accurate Rendering - Eliminating Rounding Jitter

- **Tiled, relative-to-center (RTC) coordinates**
- Coords are 32-bit offsets from their 64-bit tile centers, rendered using modified view matrix
- Memory bonus: full-precision without the cost of storing double-precision values

xeokit.github.io/xeokit-sdk/examples/#loading_XKT_jitter_fullPrecision_MAP

Read about RTC coordinates in virtualglobebook.com

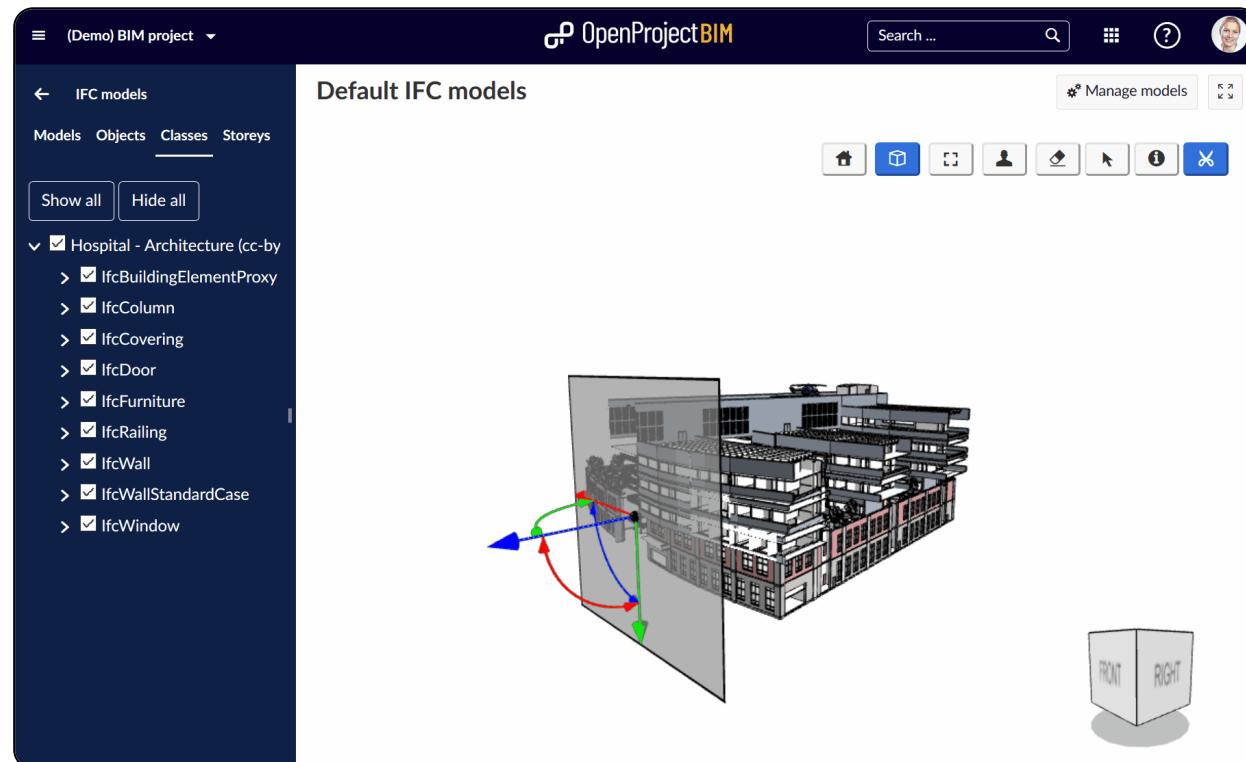

12. Navigating Precisely

- Distance-proportional rate of forward/backward movement
- Move fast in open spaces, move slow in tighter spaces
- Ray-cast every n frames to find distance to nearest object, scale dolly and zoom rates accordingly

xeokit.github.io/xeokit-sdk/examples/#CameraControl_orbit_HolterTower

13. xeokit in the Wild : OpenProject GmbH

- View multiple models
- Share issues via BCF
- Slice, highlight, X-ray
- Plan views
